There isn't all the detailed triangulation, but the basic parabolic structure is a very good look a like. Also notice in the build that there are less horizontal blocks at the beginning of each arch, and then progressively longer rows of horizontal blocks towards the top.

Leonhard Euler was one of the giants of 18th Century mathematics. Like the Bernoulli's, he was born in Basel, Switzerland, and he studied for a while under Johann Bernoulli at Basel University. But, partly due to the overwhelming dominance of the Bernoulli family in Swiss mathematics, and the difficulty of finding a good position and recognition in his hometown, he spent most of his academic ...

An arch bridge is a bridge with abutments at each end shaped as a curved arch. Arch bridges work by transferring the weight of the bridge and its loads partially into a horizontal thrust restrained by the abutments at either side. A viaduct (a long bridge) may be made from a series of arches, although other more economical structures are typically used today.

The area of study known as the history of mathematics is primarily an investigation into the origin of discoveries in mathematics and, to a lesser extent, an investigation into the mathematical methods and notation of the past. Before the modern age and the worldwide spread of knowledge, written examples of new mathematical developments have come to light only in a few locales.

Easier - Bridges are structures built over a river, railroad track, road, or some other obstacle. They allow people or vehicles to cross from one side to another. Harder - Bridges are structures used by people and vehicles to make crossing areas easier in travel. Engineers build bridges over rivers, lakes, ravines, canyons, railroads, and highways.
